# OS-3 & OS-3BOSE Bulletin

## Symptoms:

- Relay clicking on/off during key on or while driving
- Acc not turning on after Remote Start
- Excessive current draw
- Acc not shutting off with key
- Chime not active or not stopping
- Acc shuts off after connecting a steering wheel control interface

## Fix:

Connecting a diode across the supplied accessory output relay on the OS-3rad harness (as shown in pictures) will resolve these problems. Connect the cathode end of the diode to 86 on the relay and connect the anode end of the diode to 85 on the relay.
